List of functions not working correctly:

1. In the payment add function if you put in illegal characters where they should not be the application still saves the data and this also makes it so that the payment information cannot be deleted from your account. This takes place in the PaymentAddActivity and happens because we take the user entered information, convert them strings and save the information as is.
2. In the offer function if you do not use whole numbers for the rate and express cost the application will crash. This takes place in the OfferActivity and happens because we take the user entered information and convert them to integers.
3. In the address add function if you do not put in any information the application will save the data as if you put in real information. This takes place in the AddressAddActivity and happens because we take the user entered information, convert it all to string and save the information as is.
