BUMK0004	Buy		Place Order
0xFFFF		Doesn't Crash	

I create an order without the user having any saved payment or address, but the account did at one point during the current session and they created an order during this same session.

When the user does not have any payment or address currently stored, but they did at one point and they created an order during the current session the order will go through without the information.

No specific line because the app is working.

On the backend if the app stays open as the user creates an order successfully, but then deletes their payment and address, if they go to create another order without the info saved the app will push it through using the old information. This would probably be fixed by adding an if statement to check to make sure that the user actually has all the fields filled out.
